

IdeasFilter

- * Symbol > choropleth in this situation to show different types
- * Just one of the temporal displays
- * Bar or pie to show comparison in occurrences

Categorise

- * Temporal data → categorising quantitative data (deaths & occurrences) against temporal data (year)
- * Categorical data → Disaster types (bar chart & Pie chart)
- * Categorical data → Tree diagram & calendar heatmap to indicate differences in occurrences across states & months.

Combine & Refine

- * Bar Chart of disaster types, used as a filter, for calendar heatmap & tree diagram.

Questions

- * Is there a correlation with disasters & months/states?
- * Do certain types of disasters occur more in certain places?
- * What is the most deadly event / type?

Big Picture / LayoutDescription

* Location analysis

Operations / ComponentsBar Filter

* Used to demonstrate states for a breakdown.

* At top of visualisation

* Panels or dropdown

Tooltips

* In geographic map

* Highlights event, date & # fatalities.

* As the user hovers over the symbol

* Comic Book layout① Geographic map

* Shows overall view of disasters

② Calendar heatmap

* Analysis of month based on state filter

③ Line & Area to depict trends of states④ Pie, Table, Radar

* Show disaster breakdown by state

Focus

* This visualisation focus' on disasters per state.

* All visualisations will automatically adjust given the filter, except for map

* Main focus panel will be section ④

- Pie chart to indicate visual differences in occurrence

- Table depicts top 5 events,

i.e. most fatalities of events given filter (state)

- Radar graph just another depiction of comparison

Discussion / EvaluationPositives

* Segments differing data

* Projections well

* Clear focus upon each state

Cons

* Layout improvement as Comic Book style to me struggles to tell a story

* Interactivity is limited.

* Need for more annotations / descriptive summaries.

* No use of typography

Layout

Description

* Scrollable Poster of Disasters in Australia.

Operations / components

Filter

- * Will be based on disasters.
- * Panels or Dropdown of disaster types to explore
- * At top of layout

Tooltips (geographic symbol map)

- * Event, Fatalities, date

Annotations / summaries

- * Use to describe & give context

Focus

Overall focus is on disaster types

- * Follow of story based on disasters
- * Temporal analysis
- * Categorical analysis
- * Filter adjusts all graphs except map & bar chart

Evaluation

Pros

- * Easy to follow the story
- * Give context to the main issues
- * Allows exploration of disaster types.

Cons

- * The static bar chart is useless should replace
- * Room for more written explanation
- * Need to ensure colour consistency

LayoutDescription

* Scrollable narrative

Operations / componentsTooltips

- * As user hovers over map
- * Event name, date, type, fatalities

No Filters used, as I want a full exploration

Focus

The intention behind this visual is to take the user through a story

- * First section is map to indicate a visual distribution of disasters across Australia
- * Second will depict key events in Australia, will annotations
- * Third section will be temporal analysis depicting peaks & troughs over time
- * Lastly end with categorical analysis.

EvaluationPros

- * Scrolling telling allows for ease storytelling
- * Graphs are sectioned well together
- * Annotations allow good context for unfamiliar users

Cons

- * No filtering ∴ little interactivity
- * Radar is a little challenging to quickly compare

Concluding Remark

Description

* Australian Disasters Per state

Components/operations

* Filter of states

* Panels to click

* Allows state comparison

Tooltips

* hover over symbols

* Event, type, date, # fatalities

Scrolling telling

* Allows for narrative story

* Allows sections to be split

Focus

* Focus of visualisation will be a breakdown of disasters by states

* If an overall depicted is wanted, user is able to see the entirety of the data

* Main focus upon panel ② as we can see associations within states & possible seasonal factors

Detail

* Will need to ensure data is filtered accordingly, as there are some data outside of Australia, needed to be removed.

* Certain grouping will be required as there are many differing events, which may impact visibility

* Map demonstrate some issues given filtering

* Assuming interactivity throughout will be the biggest challenge.
